Art Unit: 1772

DETAILED ACTION

Specification

1. The following guidelines illustrate the preferred layout and content for patent applications. These guidelines are suggested for the applicant's use.

Arrangement of the Specification

The following order or arrangement is preferred in framing the specification and, except for the reference to "Microfiche Appendix" and the drawings, each of the lettered items should appear in upper case, without underlining or bold type, as section headings. If no text follows the section heading, the phrase "Not Applicable" should follow the section heading:

- (a) Title of the Invention.
- (b) Cross-References to Related Applications.
- © Statement Regarding Federally Sponsored Research or Development.
- (d) Reference to a "Microfiche Appendix" (see 37 CFR 1.96).
- (e) Background of the Invention.
 - 1. Field of the Invention.
 - 2. Description of the Related Art including information disclosed under 37 CFR 1.97 and 1.98.
- (f) Brief Summary of the Invention.
- (g) Brief Description of the Several Views of the Drawing(s).
- (h) Detailed Description of the Invention.
- (I) Claim or Claims (commencing on a separate sheet).
- (j) Abstract of the Disclosure (commencing on a separate sheet).
- (k) Drawings.
- (l) Sequence Listing (see 37 CFR 1.821-1.825).

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Art Unit: 1772

3. Claims 9-17 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as

the invention.

Claim 9 is indefinite for containing the limitation "such as transdermal therapeutic

systems", terms like "such as" are considered to be indefinite.

Claim 15 is indefinite for reciting the term "renders", it is unclear to one of ordinary skill in

the art whether the heat sealing layer renders or comprises a chemical composition which is

sufficiently inert to nicotine.

4. The term "sufficiently" in claim 15 is a relative term which renders the claim indefinite.

The term "sufficiently" is not defined by the claim, the specification does not provide a standard

for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably

apprised of the scope of the invention.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness

rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the

manner in which the invention was made.

Application/Control Number: 09/308,407

Art Unit: 1772

6. Claims 9-12 and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wardell (U.S. Patent No. 3,938,659) in view of Hunt et al. (U.S. Patent No. 5,077,104).

Page 4

Wardell teaches a packaging system made of a composite packaging material for the sealed enclosure of products for pharmaceutical products comprising a heat sealing layer wherein the heat sealing layer is formed by an active ingredient-resistant, said active-ingredient resistant layer being applied from the liquid phase in a printing method and, after heat-activated sealing, displaying adhesion forces which are in the region of strength of the packaging materials and wherein the heat sealing layer covers only the sealing area (column 3, lines 1-68, column 4, lines 1-68, column 5, lines 1-20 and Fig. 2). Although Wardell does not specifically teach that the active ingredient-resistant layer has a thickness of maximally 15 g/m² or between 2.5 and 3.5 g/m², it would have been an obvious matter of design choice to fabricate an active ingredient-resistant layer has a thickness of maximally 15 g/m² or between 2.5 and 3.5 g/m², since such a modification would have involved a mere change in the size of a component. A change in size is generally recognized as being within the level of ordinary skill in the art. *In re Rose*, 105 USPQ 237 (CCPA 1955) (applies to instant claims 9 and 11-12).

The difference between the instant claims and Wardell is that Wardell does not teach a packaging system for pharmaceuticals comprising a barrier layer on the product side to which barrier layer there is applied a heat sealing layer and wherein the barrier layer comprises aluminum.

Application/Control Number: 09/308,407

Art Unit: 1772

Hunt et al. teach a packaging system for pharmaceuticals comprising a barrier layer on the product side to which barrier layer there is applied a heat sealing layer and wherein the barrier layer comprises aluminum (abstract, column 2, lines 48-68, column 4, lines 48-68, column 5, lines 1-34 and Figs. 2-3 and 6-7) (applies to instant claims 9 and 14).

Page 5

One of ordinary skill in the art would have been motivated to combine the teachings of Wardell and Hunt et al. because both references teach a packaging system for pharmaceuticals sealed by heat sealing and Hunt et al. provides a barrier which prevents the degradation of pharmaceuticals.

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the packaging system of Wardell by fabricating a packaging system comprising a barrier layer on the product side to which barrier layer there is applied a heat sealing layer and wherein the barrier layer comprises aluminum according to the teachings of Hunt et al. because by fabricating such a packaging system, a packaging system which prevents the degradation of pharmaceuticals is obtained.

7. Claims 13 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wardell (U.S. Patent No. 3,938,659) in view of Hunt et al. (U.S. Patent No. 5,077,104), as applied to claims 9-12 and 14, and further in view Flieger (U.S. Patent No. 5,447,772).

Hunt et al. teach a packaging system which is inert to nicotine (abstract, column 2, lines 48-68, column 4, lines 48-68, column 5, lines 1-34 and Figs. 2-3 and 6-7) (applies to instant claim 15).

Art Unit: 1772

The difference between the instant claims and Wardell is that Wardell does not teach a packaging system wherein the heat sealing layer comprises an ethylene/methacrylic acid dispersion which displays no measurable active ingredient uptake and wherein heat sealing layer comprises a chemical composition which is sufficiently inert to nicotine.

Flieger teaches a packaging system wherein the heat sealing layer comprises an ethylene/methacrylic acid dispersion (column 2, lines 3-40) (applies to instant claim 13).

Although Flieger does not specifically teach a packaging system wherein the heat sealing layer displays no measurable active ingredient uptake and wherein heat sealing layer comprises a chemical composition which is sufficiently inert to nicotine, it is the position that these properties are inherent in the heat sealing layer of Flieger because the heat sealing layer is made from the same material as that which is recited by the applicant in claim 13 (applies to instant claim 13 and 15).

One of ordinary skill in the art would have been motivated to combine the teachings of Wardell and Flieger because both references teach a packaging system comprising a heat sealing layer wherein the seal delaminates and Flieger teach a heat sealing layer with improved delaminating properties.

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the packaging system of Wardell by fabricating a packaging system wherein the heat sealing layer comprises an ethylene/methacrylic acid dispersion which displays no measurable active ingredient uptake and wherein heat sealing layer comprises a chemical

Art Unit: 1772

composition which is sufficiently inert to nicotine according to the teachings of Flieger because by fabricating such a packaging system, a packaging with improved delaminating properties is obtained.

8. Claims 16 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wardell (U.S. Patent No. 3,938,659) in view of Hunt et al. (U.S. Patent No. 5,077,104), as applied to claims 9-12 and 14, and further in view of Wilking (U.S. Patent No. 5,698,217).

The difference between the instant claims and Wardell not yet discussed is that Wardell does not teach a packaging system comprising a layer within an area which is enclosed by the sealing layer, said enclosed layer entering into interaction with the packaged product and wherein the enclosed layer is formed by a moisture absorbent layer.

Wilking teaches a packaging system comprising a layer within an area which is enclosed by the sealing layer, said enclosed layer entering into interaction with the packaged product and wherein the enclosed layer is formed by a moisture absorbent layer (column 2, lines 1-67, column 5, lines 1-67 and Fig. 1) (applies to instant claims 16 and 17).

One of ordinary skill in the art would have been motivated to combine the teachings of Wardell and Wilking because both references teach a sealed packaging system for pharmaceuticals and Wilking provides a packaging system which prevents degradation of pharmaceuticals from moisture.

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the packaging system of Wardell by fabricating a packaging system

Art Unit: 1772

comprising a layer within an area which is enclosed by the sealing layer, said enclosed layer entering into interaction with the packaged product and wherein the enclosed layer is formed by a moisture absorbent layer according to the teachings of Wilking because by fabricating such a packaging system, a packaging system which prevents degradation of pharmaceuticals from moisture is obtained.

Conclusion

9. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Kwiatek et al. (U.S. Patent No. 4,573,996), Hsu et al. (U.S. Patent No. 4,700,531), Bayer et al. (U.S. Patent No. 4,956,181), Allen et al. (U.S. Patent No. 5,567,489) and Koch et al. (U.S. Patent No. 6,054,196) are cited as relevant prior art.

Any inquiry concerning this communication should be directed to Mike Miggins whose telephone number is (703)305-0915. The examiner can normally be reached Monday to Friday from 9:30 AM to 6:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ellis Robinson, can be reached on (703)308-2364. The fax phone number for the organization where this application or proceeding is assigned is (703)305-3599.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703)308-0661.
